BII2000 Series AGC (Automatic Gain Control) Amplifier: 100 dB Gain Dynamic Range, 100Hz to 1MHz Bandwidth.

BII's Automatic Gain Control (AGC) amplifier is a dynamic adaptive electronic system whose gain changes automatically with input levels of continuous waveform (CW) or pulsed signals such as SINE pulses, Chirp/FM pulses, BFSK/FSK, etc. Its output signal level is always in detectable range for DAQ modules (A/D Converters) although the input signal levels vary in a wide range. That is, the AGC effectively attenuates the strong input signals to avoid saturation and amplifies weak signal to be in the range of Volt. BII AGCs are necessary components in acoustic systems to automatically compensate the propagation losses in water, air, and solids.

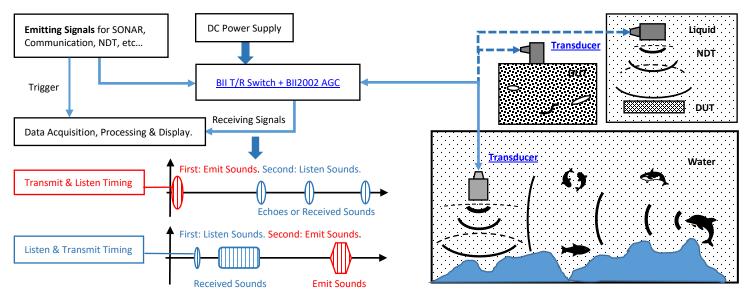

Typical Applications:

Underwater Communication/Pinger/Beacons/Transponder.	Acoustic Modem, BFSK/FSK Signal Conditioning.	
Echosounding, Marine Mammal Research, Bioacoustics.	Navigation, Positioning, Acoustic Tag.	
Doppler SONAR, Speed Measurement, Artificial Acoustic Target.	Ultrasonic Pulsing System, NDT, AE, Diagnostic Ultrasound, Material Study.	

System Setup (DC Power Supply is not shown.)

System Block Diagram of Acoustic Pulse-echo and Communication Systems

SPECIFICATION

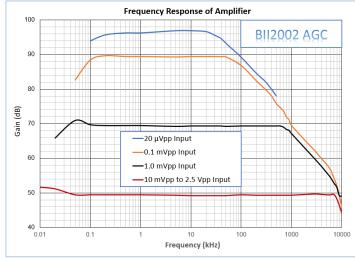

AGC Amplifier	BII2002			
	Sine Pulses, Chirp/FM Pulses, BFSK/FSK, Continuous Signals, etc.			
Signal Types:	Pulse duration of pulsed/burst signals such as SONAR and NDT signals should be greater than 10µS to achieve stable output signal.			
Automatic Gain Range:	-20 to 80 dB			
High Pass Filter:	Built-in. Specify -3dB cut-off frequency when ordering. White noise level is proportional to the square root of bandwidth.			
	Second Order.			
	100 Hz ~ 1 MHz, Input level dependant. Refer to <u>Frequency Response</u> .			
	Filters of Preamps. Both oceanic ambient noises and the self-noises of electronic devices decrease when frequency increases.			
	It is recommended to choose a built-in high pass filter to reject noises in low frequency range. For example, if you are interested in			
	the signals greater than 10 kHz, you may specify a high pass filter of a preamp with -3dB cut-off frequency 1 kHz to improve signal			
	to noise ratio of the signals of the interest.			
-3dB Bandwidth:	More info on High Pass Filter: Frequency Response of BII2002 AGC Core is 100Hz to 1 or 10MHz (Input level dependant) and BII2002			
	amplifies and tracks peak voltages of arbitrary signals. A proper high pass filter attenuates low frequency noise level and ensures			
	that signal levels of useful signals are significant and dominate which are amplified and tracked by the AGC Amplifier.			
	System Filters Consisting of Standalone Piezoelectric Hydrophones and Standalone Preamps.			
	-3dB High Pass Frequency: $f_{-3dB} = 1/(2\pi R_i C_h)$.			
	R: Input Resistance or Impedance of Preamp. Ch: Capacitance of piezoelectric hydrophone/sensor/transducer at 1 kHz (non-			
	resonance measurement) or f _s (resonance measurement such as NDT pulsing system).

SE-SL-TETAG-INE					
	For example: hydrophone 0.1nF at 1kHz and preamp R_i 10M Ω constitute high pass filter with -3dB frequency 159Hz.				
	For example: hydrophone 1.0nF at 1kHz and preamp R_i 10M Ω constitute high pass filter with -3dB frequency 15.9Hz.				
Settling Time:	3 μS to 0.1%, Output Step 10 Vpp.				
Input Level Range V _i :	20 μVpp to 20 Vpp, or -103 to +17 dB Vrms.				
Input Range of Receiver:	(V_i dB Vrms - Receiver Sensitivity dB V/ μ Pa), in μ Pa.				
	For example, a hydrophone has FFVS of -190 dB V/ μ Pa, Detection range = (-103 +190) to (17 + 190) = 87 to 207 dB μ Pa.				
Input Impedance:	$10 \text{ M}\Omega \mid\mid 11 \text{ pF. Refer to } \frac{\text{R}_{i}\text{C}_{h} \text{ Filter}}{\text{R}_{i}}$.				
Input Couling:	AC				
Input Signal Type:	Differential (DF) and Single ended (SE) are acceptable.				
Input Referred Noise:	e _n = 10.0 nV/vHz, i _n = 0.8 fA/vHz.				
(at f ≥ 1 kHz)	Roughly, electronic noise density at input, $V_n^2 = e_n^2 + [i_n^* impedance of the transducer (or hydrophone)]^2$.				
Input Dynamic Range:	≥ 90 dB				
Output Level:	0.2 to 3.2 Vpp, or -23 to 1.07 dB Vrms.				
Output Type:	Single Ended				
Output Impedance:	50 Ω				
Output Couling:	AC				
Capability of Driving Cable:	50 m				
Supply Voltage V _s :	+16 to +32 VDC				
Current (Quiescent):	21.3 mA				
	+9VDC Battery, Marine Battery, Automobile Battery, Fixed DC Linear Power Supply, Not Included.				
Suggested DC Supply:	DO NOT use variable power supply whose maximum supply voltage is higher than the above rated voltage.				
	DO NOT use switching mode DC power supply.				
Operating Temperature:	-40°C to 60°C, or -40°F to 140°F.				
Storage Temperature:	-20°C to 60°C, or -4°F to 140°F.				
Package	Coated PCB with Wires and Wire Leads				
	5cm wires, twisted.				
Input Wiring:	Differential Input Wiring: Red: Input Signal +, Blue: Input Signal -, and Use Power Supply Common as input signal common.				
	Single-ended Input Wiring: Red: Input Signal, Blue: Input Common and wire Blue Wire to Power Supply Common.				
Output Wiring:	5cm wires.				
Supple Wing.	Twisted. White: Output Signal, Black : Output Common.				
Power Supply Wiring:	5cm wires, twisted. Red: +VDC, Black: Common. Use this common as differential input common.				
Weight:	20 grams				
Size:	ΦDxH = Φ48x15 mm				
Package	Metal or Plastic Housing with four mounting holes				
Input Connector:	XLR Jack (Differential), TRS Jack (Differential), or BNC Jack (Single-ended).				
Output Connector:	BNC Jack				
Power Supply Connector:	Power Connector Jack				
Power Supply Cable:	DCBP24				
Weight:	0.25 kg				
Size:	LxWxH = 95x59x47mm (Metal Enclosure), or 109.4x83.4x67mm (Plastic Enclosure).				

Frequency Response

High Pass Filter vs. Ch of Hydrophone, AE, or NDT Transducer.

System Wirings of Standalone Preamp.

One 1m DC supply cable. One end is with Red and Black Banana Plugs, another end of the cable is with DC Power Plug. Depending on output terminals of buyer's DC Supply, buyer may assemble other type of connectors to DC supply cable at buyer's cost.

benthowave.com Revised on 2025/01/22

Frequencies of my pingers (transponder, or beacon) range from 20 kHz to 100 kHz, what are the gains of BII AGC to amplify the signals automatically? Gain-bandwidth of BII AGC is 250MHz. that is, BII AGC can amplify 20 kHz signals with 80 dB (x10000 times) and amplify 100 kHz signals with 66 dB (x2000 times).

What if the connector of my transducer/sensor is SMA or SMC Connector? Buyer may order a SMA (or SMC) to BNC (Male) adaptor from local electronic distributors in buyer's country. BII may ship the adaptor as accessory of the device. Please specify this request when ordering. By default, BII does NOT supply the adaptor as accessories.

How do I wire 50Ω transducer/sensor to BII AGC Amplifier? BII AGC Amplifier has non-50Ω input resistance. One T type BNC adaptor and one 50Ω BNC terminal are necessary between 50Ω transducer/sensor and BII AGC to change the impedance of BII AGC to be 50Ω. BII may ship T type BNC adaptor and one 50Ω BNC terminal as accessories of the device. Please specify this request when ordering. By default, BII does NOT supply these two parts as accessories.

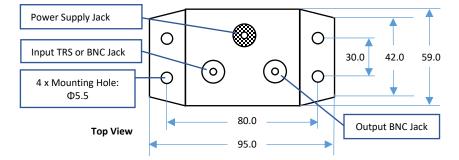

How do I wire BII AGC Amplifier to audio connectors (XLR or TRS) of my recording devices? BII AGC Amplifier has panel mount BNC jack as output connector. Therefore, one cable assembly from male BNC to XLR or male BNC to TRS plug are necessary between BII AGC and the recording devices. BII may ship the cable assembly as accessory of the device. Please specify this request when ordering. By default, BII does NOT supply the cable assembly as accessories.

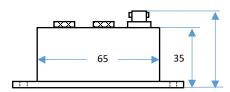

My acoustic sensors generate differential signals in MHz range, are TRS connectors of BII preamps suitable for my applications? Our test shows the TRS connectors (Plug and Jack) of BII preamps can be used up to 20 MHz. Test Conditions: TRS Jack with 0.2m cable and TRS plug with 1m cable. Oscilloscope: 1MΩ | 30pF, Signal Source: DDS Signal Generator.

Can 3.5mm (1/8") TRS be configured for single-ended signal of a hydrophone/transducer which does not have built-in preamplifier? Yes, the preamp with differentialinput TRS can accept single-ended signals from hydrophones/transducers whose TRS wiring should be like followings: TRS Tip: Signal. TRS Ring and Sleeve: Both terminals are soldered together for Signal Common and Shielding. Common and shielding should be "one-point" contact.

Can BII explain why the capacitance of my hydrophone/transducer affect high pass filtering? (1). Hydrophone/transducer is high impedance devices in low frequency range. Its simplified complex impedance = j/(2πfCh), Ch is the capacitance of hydrophone/transducer, f is frequency in Hz. This impedance is in series with preamp Ri and can reach several M Ω to hundreds M Ω depending on C_h and f. (2). Most high-performance operational amplifiers (IC chips) can use input resistors R_i up to 1 to 200 M Ω to avoid bumping into saturation issue.
